

### SUPERVISOR'S DECLARATION

We hereby declare that we have checked this thesis and in our opinion, this thesis is adequate in terms of scope and quality for the award of the degree of Master of Engineering.

(Supervisor's Signature)

Full Name : DR. ROSDIYANA BINTI SAMAD

Position : SENIOR LECTURER

Date : 26/4/2018

(Co-supervisor's Signature)

Full Name : DR. DWI PEBRIANTI

Position : SENIOR LECTURER

Date : 26/4/2018

### STUDENT'S DECLARATION

I hereby declare that the work in this thesis is based on my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other degree at Universiti Malaysia Pahang or any other institutions.

A handwritten signature in black ink is written over a horizontal line. The signature is stylized and appears to be 'Muhammad Zabri Bin Abu Bakar'.

(Student's Signature)

Full Name : MUHAMMAD ZABRI BIN ABU BAKAR

ID Number : MEE14001

Date : 26/4/2018

DEVELOPMENT OF A COMPUTER VISION-BASED TECHNIQUE FOR  
ANALYSIS OF HAND THERAPY EXERCISE

MUHAMMAD ZABRI BIN ABU BAKAR

Thesis submitted in fulfillment of the requirements  
for the award of the degree of  
Master of Engineering

Faculty of Electrical & Electronics Engineering  
UNIVERSITI MALAYSIA PAHANG

MAY 2018

## ACKNOWLEDGEMENTS

In the name of Allah, the most Beneficent, the most Merciful, lord of the universe, Praise is to Allah who gave me the power, the strength, the motivation, help and patience to complete this study while going through so many hurdles and obstacles. Blessings and peace be upon our final prophet and messenger Muhammad (peace be upon him) who was sent by Allah to be a great teacher of human kind. First and above all, I would like to thank God for giving me great health and all the internal resources for the fulfilment of this master endeavour.

I would like to express my heartiest thanks to my supervisor, Dr. Rosdiyana Binti Samad, for receiving me with open arms and providing endless support, advice as well as devotional time throughout my research. Thank you for teaching me on how to arrange my research and innovate my ideas to achieve my goal. You have been my inspiration in both personal and professional aspects and do not forget to my co-supervisor Dr. Dwi Pebrianti for the support and advice. Thank you.

I would also like to extend my acknowledgement to my family for their affectionate understanding and love throughout my master study, my father Abu Bakar bin Mamat, my mother Zanariah binti Isa, my wife Noraziah binti Razali, my sister and my brother. No words could express my deepest gratitude for them. Their support and endless efforts have relieved my worries and enabled me to concentrate on my research.

Lastly, my deepest gratitude goes to all the people who have directly or indirectly involved in this research. Without them, this research could never have been completed.

## ABSTRAK

Senaman terapi tangan berdasarkan sistem penglihatan komputer mempunyai banyak manfaat dan telah menarik minat para penyelidik ke arah membangunkan aplikasi penglihatan komputer. Inovasi alat pengukuran untuk senaman telah mengalami penambahbaikan yang berterusan hingga ke hari ini, di mana sebahagiannya menggunakan “*wearable sensor*”, bantuan robot dan penglihatan komputer. Sistem yang telah dibina menggunakan kaedah penglihatan komputer melibatkan struktur badan manusia yang fleksibel dan menyebabkan “*self-occlusion*”. Masalah lain ialah teknik pengesanan menggunakan kamera biasa yang tidak mudah dan memerlukan masa untuk dibangunkan. Tujuan penyelidikan ini adalah untuk membangunkan teknik berasaskan penglihatan komputer untuk menganalisis senaman terapi tangan dan untuk menilai pengukuran sudut yang telah dicadangkan dengan alat pengukuran konvensional, iaitu goniometer. Dalam tesis ini, senaman Latihan Bergerak (*Range of Motion (ROM)*) untuk pergelangan tangan dan siku dengan menggunakan sensor Kinect dibentangkan dan senaman ini memberikan maklum balas dalam masa nyata untuk setiap pergerakan. Kedua-dua senaman, iaitu pergelangan tangan “*radial/ulnar*” dan lenturan siku “*flexion/extension*” adalah terdiri daripada pengukuran sudut pada sendi. Algoritma yang digunakan adalah pengesanan dan penjejakkan tangan, pengesanan hujung jari, pengesanan sendi rangka dan juga algoritma pengukuran sudut pada sendi. Kemudian, nilai-nilai sudut sendi boleh disimpan secara automatik. Hasil keputusan bagi pengukuran sudut sisihan pergelangan tangan “*radial/ulnar*” menunjukkan perbezaan daripada sudut rujukan sebanyak  $\pm 6^\circ$ . Manakala, hasil bagi pengukuran sudut sendi siku “*flexion/extension*” adalah sebanyak  $\pm 8^\circ$  dari sudut rujukan. Nilai-nilai ukuran hampir sama dengan nilai-nilai rujukan piawai ROM iaitu  $20^\circ$  untuk “*radial*”,  $-30^\circ$  untuk “*ulnar*”,  $140^\circ$  untuk “*flexion*” dan  $0^\circ$  untuk “*extension*”. Algoritma telah berjalan dengan baik dan boleh mengikuti pergerakan pada masa nyata. Sistem senaman menggunakan sensor Kinect mampu menjadi alat latihan yang mudah alih, mudah untuk dipasang dan diletakkan di mana-mana. Data pengukuran sudut boleh disimpan dan boleh digunakan untuk rujukan pada masa hadapan. Pengesanan dengan alat konvensional dalam pengukuran sudut menunjukkan bahawa ukuran sudut adalah lebih tepat berbanding goniometer kerana ia boleh mengukur skala yang lebih kecil.

## ABSTRACT

Hand therapy exercises based on computer vision system have many benefits and this has attracted the interest of researchers towards building a computer vision application. The innovation of measurement tool in computer vision application for the exercise also have undergone continuously improvement which is using wearable sensor, robot aid and computer vision. The hand therapy exercise system that was built using computer vision method involved highly flexible structure of the human body and causes a self-occlusion. Another problem is tracking techniques using an ordinary camera are not easy and require extensive time to develop. The aim of this research is to develop a computer vision-based technique for analysis of hand therapy exercise and to evaluate the propose angle measurement with the conventional measurement tool, which is goniometer. In this thesis a Range of Motion (ROM) exercises for wrist and elbow by using the Kinect sensor is presented and this exercise provides a real-time feedback for every movement. Both exercises, which are wrist radial/ulnar deviation and elbow flexion/extension also consists of joint angle measurement. For this purpose, the ROM exercise was developed by using the hand detection and tracking, fingertips detection, skeleton joints detection algorithms and joint angle measurement algorithm. Then, the joint angle values can be saved automatically. The result for the measurement of wrist radial/ulnar deviation angle shows its value is different from the reference angle of  $\pm 6^\circ$ . Meanwhile, the result for the measurement of elbow flexion/extension joint angle was different at  $\pm 8^\circ$  from the reference angle. These measurement values are almost similar to the standard ROM reference values which are  $20^\circ$  for radial deviation,  $-30^\circ$  for ulnar deviation,  $140^\circ$  for flexion and  $0^\circ$  for extension. The algorithm worked well and could follow the movement of the upper arm and forearm in real-time. This exercise system that uses Kinect sensor is able to be a portable exercise tool, which is easy to install and to be placed anywhere. The joint angle measurement data can be saved and can be used for reference in the future. The validation with the conventional tool for angle measurement (goniometer) shows that the joint angle measurement with the proposed technique is more precise compared to the goniometer because it can measure the small scale of angle in degree.
